NATIONAL STANDARD PETROLEUM OIL TABLES

ABSTRACT

The tables given are based on an investigation of American petroleum oils carried out by the National Bureau of Standards, and the arrangement is largely according to the recommendations of a committee appointed by the American Petroleum Institute to represent the petroleum industry.

In order to overcome the confusion that has existed in the petroleum-oil industry by reason of the use of two so-called Baumé scales for light liquids, the American Petroleum Institute, the U. S. Bureau of Mines, and the National Bureau of Standards, in December 1921, agreed to recommend that in the future only the scale based on the modulus 141.5 be used in the petroleum-oil industry, and that it be known as the A. P. I. scale. The relation of degrees A. P. I. to specific gravity is expressed by the formula

$$\text{Degrees A. P. I.} = \frac{141.5}{\text{sp gr } 60^{\circ}/60^{\circ} \text{ F}} - 131.5$$

A certain degree of accuracy in the determination of the temperature is essential in order to have results that are comparable with the determination of the gravity of the oil.

Tables 1, 2, and 3 give the degrees A. P. I., the volume, and the specific gravity of oil at 60° F from the values observed at other temperatures. Tables 4 and 5 give the relation between specific gravity, degrees A. P. I., pounds per gallon, and gallons per pound. Table 6 gives the degrees A. P. I. (modulus 141.5) corresponding to degrees Baumé (modulus 140).

Tables 1, 2, 4, and 5 in this revised edition have been extended to include oils having specific gravities from 1.000 to 1.076; that is, oils covering the A. P. I. range of 10 to 0 degrees.

Table 3 has not been so extended as this table appears to be little used in the oil industry. The information, in terms of specific gravity, for the extended range can be obtained, if desired, by use of tables 4 and 1.

I. INTRODUCTION.

1. BASIS OF TABLES.

The tables contained in this circular are based largely on an investigation of American petroleum oils carried out by the

Bureau of Standards in 1912-1915 and published in Technologic Paper No. 77. The original information has been supplemented by additional investigation of the rate of expansion of oils at temperatures beyond the range originally covered.

2. ARRANGEMENT AND RANGE OF TABLES.

The arrangement of the tables and also the density and temperature range covered have been given careful consideration both by the bureau and by a special committee appointed by the American Petroleum Institute to represent the petroleum industry.

3. ORIGIN OF THE AMERICAN PETROLEUM INSTITUTE (A. P. I.) SCALE.

When the Bureau of Standards first took up the testing of hydrometers in 1904, careful inquiry was made of the manufacturers and users of these instruments as to the basis of the various scales in common use.

In the case of hydrometers for petroleum oils the scale said to be in general use was the so-called Baumé scale for liquids lighter than water. The relation of this scale to specific gravity is expressed by the formula

$$\text{Degrees Baumé} = \frac{140}{\text{sp. gr. } 60^\circ/60^\circ \text{ F.}} - 130.$$

Subsequently, it was learned that a great number of the hydrometers used in the oil trade were not on the basis of the above relation, but were more nearly in agreement with a scale represented by substituting 141.5 and 131.5 in the above formula in place of 140 and 130. Accordingly, new tables were published by a manufacturer of hydrometers and by oil companies on this basis; that is, the actual hydrometer scales were continued unchanged and the relation to specific gravity was redefined, the new scale still being commonly known as the Baumé scale. At the same time other manufacturers and users of oil hydrometers continued the use of the original Baumé scale. As a result much confusion has existed in the petroleum-oil industry by reason of the use of two so-called Baumé scales for light liquids, one based on the modulus 140 and the other on the modulus 141.5.

The American Petroleum Institute, the U. S. Bureau of Mines, and the U. S. Bureau of Standards in December, 1921, agreed to recommend that in the future only the scale based on the modulus 141.5 be used in the petroleum-oil industry, and that it be known as the A. P. I. scale, to clearly distinguish it from the original Baumé scale for light liquids.

In order to make possible the use during the transition period of such Baumé hydrometers as may be on hand, there is included in this circular a table showing the degrees A. P. I. (modulus 141.5) corresponding to degrees Baumé (modulus 140). (See Table 6.)

4. SPECIFIC GRAVITY AND POUNDS PER GALLON.

Specific gravity, as used in this circular, is defined as the ratio of the weight of a given volume of oil at 60° F. to the weight of the same volume of water at the same temperature, all weighings being corrected for the buoyancy of air.

The weight per gallon of oil is the apparent weight of a volume of 231 cubic inches of oil at 60° F. when weighed in air, of 50 per cent humidity, and at a pressure of 760 mm of mercury, and against brass weights of 8.4 density or against weights reduced to that basis. The assumed weight of a gallon of water at 60° F. in air is 8.32828 pounds.

5. CALCULATION OF WEIGHT PER GALLON.

Specific gravity, as used throughout this circular, is "true specific gravity"; that is, all weighings are corrected for the buoyancy of the air. It is necessary, therefore, to change these values to "apparent specific gravity" before they can be multiplied by the weight of a gallon of water to give the weight of a gallon of oil at 60° F. in air.

The magnitude of the correction to specific gravity is shown in the following table:

True specific gravity at 60°/60° F.	Correction.	Apparent specific gravity at 60°/60° F.
0.60	-0.00047	0.59953
.70	- .00035	.69965
.80	- .00023	.79977
.90	- .00012	.89988
1.0000000	1.00000

The necessary change of specific-gravity basis has been made in the calculation of the tables, and the only reason for calling attention to it is to point out the reason why the tabulated weights per gallon, as given in the tables, are not obtained by a simple multiplication of the specific gravity at 60° F. by the weight of a gallon of water at 60° F. in air.

6. APPLICABILITY OF THE TABLES.

The tables given in this circular apply to all petroleum oils, both crude and refined, produced in the United States. Each grade of oil, gasoline, illuminating oil, lubricating and fuel oil, etc., falls into its proper place in the tables by reason of its specific gravity.¹

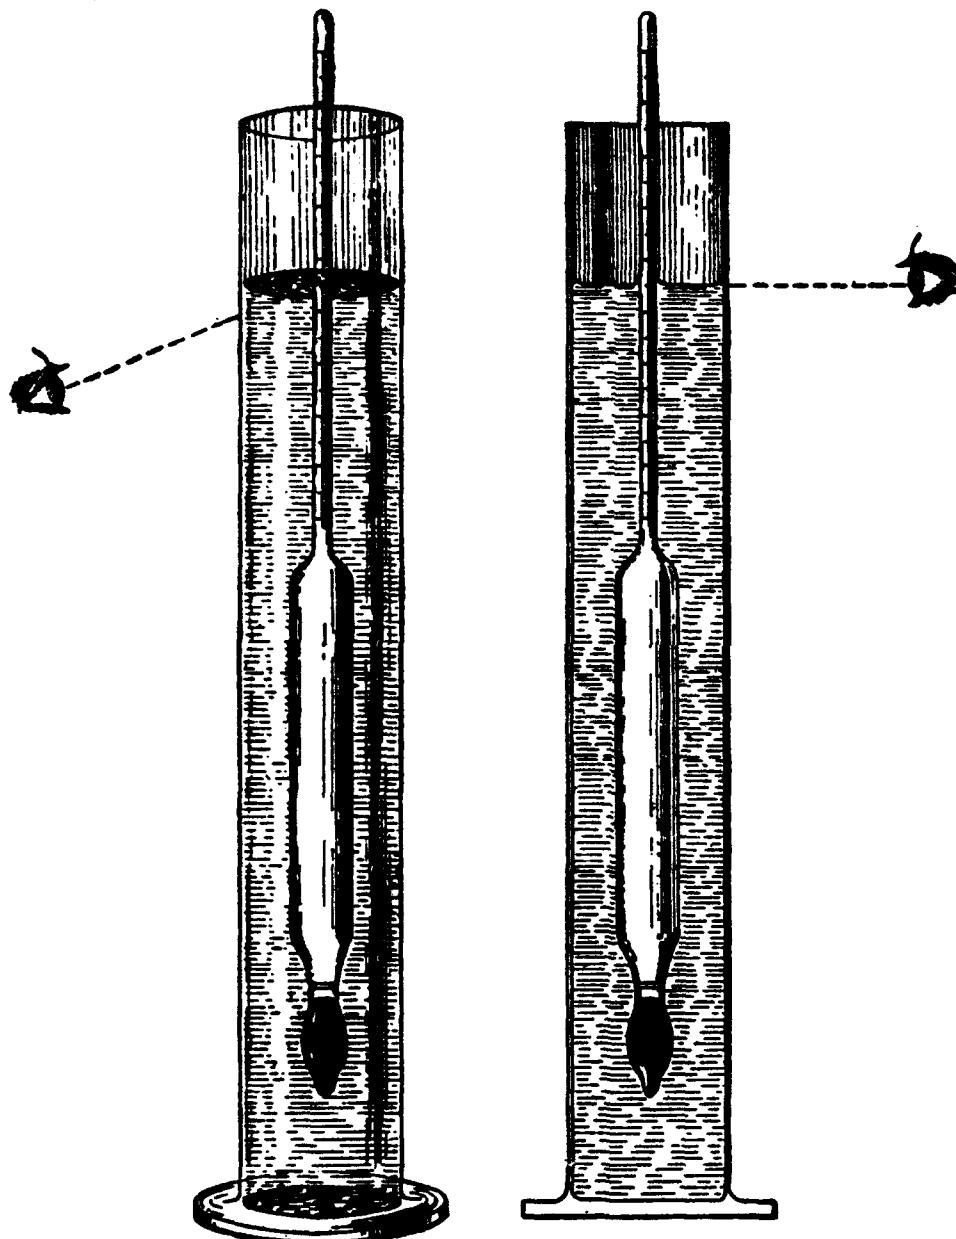

FIG. 1.

FIG. 2.

Although it is generally believed that California oils have a considerably higher rate of expansion than do oils from the

¹ In the case of oils containing paraffin or other materials that become solid at low temperatures the expansion shown by the tables is somewhat too small at temperatures below the point of solidification.

Central and Eastern States, this has not been found to be the case, and the slightly higher rate is not sufficient to cause an appreciable error in the results given in the tables.

7. METHOD OF READING THE HYDROMETER.

The correct method of reading the hydrometer is illustrated in Figures 1 and 2. The sample of oil is placed in a clear glass jar or cylinder and the hydrometer carefully immersed in it to a point slightly below that to which it naturally sinks and is then allowed to float freely.

The reading should not be taken until the oil and the hydrometer are free from air bubbles and are at rest. In taking the reading the eye should be placed slightly below the plane of the surface of the oil (fig. 1) and then raised slowly until this surface, seen as an ellipse, becomes a straight line (fig. 2). The point at which this line cuts the hydrometer scale should be taken as the reading of the instrument (fig. 2).

In case the oil is not sufficiently clear to allow the reading to be made as above described, it will be necessary to read from above the oil surface and to estimate as accurately as possible the point to which the oil rises on the hydrometer stem. It should be remembered, however, that the instrument is calibrated to give correct indications when read at the principal surface of the liquid. It will be necessary, therefore, to correct the reading at the upper meniscus by an amount equal to the height to which the oil creeps up on the stem of the hydrometer. The amount of this correction may be determined with sufficient accuracy for most purposes by taking a few readings on the upper and the lower meniscus in a clear oil and noting the differences.

A specific-gravity hydrometer will read too low and an A. P. I. hydrometer too high when read at the upper edge of the meniscus. The correction for meniscus height should, therefore, be added to a specific-gravity reading and subtracted from an A. P. I. reading.

The magnitude of the correction will obviously depend upon the length and value of the subdivisions of the hydrometer scale and must be determined in each case for the particular hydrometer in question.

8. DETERMINATION OF TEMPERATURE.

The determination of the temperature of an oil should be made to a degree of accuracy that is comparable with the accuracy of

the determination of the gravity of the oil. If the reading of an A. P. I. hydrometer is made to the nearest 0.1 degree A. P. I., it is necessary that the temperature measurement be made to 1° F. for an oil having an A. P. I. reading of about 58. For an oil having a reading of 90 degrees A. P. I. the temperature measurement must be made to 0.5° F., while for an oil of 10 degrees A. P. I. the temperature measurement may be taken to the nearest 2° F. and have the same order of accuracy as the determination of A. P. I. gravity. It is therefore necessary that the thermometer be corrected for errors in calibration, so that the temperature as determined may be well within the limits given above.

If the thermometer is not made as a part of the hydrometer, the thermometer should be so placed that the bulb can assume the temperature of the oil, and as much of the mercury column as is feasible should be immersed. This is of considerable importance, especially if the temperature of the oil differs greatly from that of the surrounding air. For example, if the temperature of the oil equals 200° F. an emergent column of 50° F. on the scale (approximately 2 inches) will cause an error in the temperature measurement of about 0.5° F., provided the average temperature of the emergent column equals 90° F.

In reading a thermometer accurately care must be taken that the line of sight is perpendicular to the thermometer scale in order to avoid parallax.

TABLE 1.—Reduction of Observed Degrees A. P. I. to Degrees A. P. I. at 60° F.

[This table shows the degrees A. P. I. at 60° F. of oils having, at the observed temperatures, the degrees A. P. I. indicated. For example, if the observed degrees A. P. I. at 78° F. is 20.0, the degrees A. P. I. at 60° F. will be 19.0. Intermediate values can be conveniently interpolated. For example, if the observed degrees A. P. I. at 78° F. is 20.4, the degrees A. P. I. at 60° F. will be 19.4. The headings "Observed degrees A. P. I." and "Observed temperature" signify the true indication of the hydrometer and the true temperature of the oil; that is, the observed readings corrected for instrumental errors. (This table is so computed as to take into account the thermal expansion of the glass of which the hydrometer is made.)]

TABLE 2.—Volume at 60° F. Occupied by Unit Volume at Indicated Temperature.

[This table shows the volume occupied at 60° F. by a quantity of oil of any A. P. I. gravity at 60° F. occupying unit volume at the indicated temperatures. For example, if at 60° F. the A. P. I. gravity of the oil is 22, 1 gallon of this oil measured at 105° F. will have a volume of 0.9822 gallons at 60° F. Intermediate values can conveniently be interpolated when necessary. The values given in the body of the table are in the form of "multipliers"; that is, the volume of oil at the indicated temperature and degrees A. P. I. multiplied by the corresponding factor in the table equals the volume at 60° F. For example, if the A. P. I. gravity of an oil at 60° F. equals 22.0 and the volume at 105° F. equals 5,600 gallons, then the volume at 60° F. equals $5,600 \times 0.9822$, or 5,500.32 gallons. This table can also be used to calculate the percentage change of volume to reduce to 60° F. The percentage factor is 100 times the difference between the tabulated value and unity. For example, in the case given above, the percentage factor is 100 ($1.0000 - 0.9822$)—1.78; that is, any volume of an oil of 22.0 degrees A. P. I. at 60° F., measured at 105° F., will decrease in volume by 1.78 per cent on being reduced to a temperature of 60° F. For observed temperatures below 60° F. the volume correction should be added to the measured volumes; for temperatures above 60° F. it should be subtracted.]

TABLE 2.—Volume at 60° F. Occupied by Unit Volume at Indicated Temperature.

Observed temperature in °F.	Degrees A. P. L. at 60° F.

TABLE 3.—Reduction of Observed Specific Gravities to Specific Gravities at 60°/60° F.

[This table shows the specific gravity at 60°/60° F. of oils having, at the observed temperatures, the specific gravity indicated. For example, if the observed specific gravity at 95° F. is 0.740 the specific gravity at 60°/60° F. will be 0.7553. Intermediate values can be conveniently interpolated. For example, if the observed specific gravity at 95° F. is 0.7405 the specific gravity at 60°/60° F. will be 0.7558. The headings "Observed specific gravity" and "Observed temperature" signify the true indication of the hydrometer and the true temperature of the oil; that is, the observed readings corrected for instrumental errors. (This table is so computed as to take into account the thermal expansion of the glass of which the hydrometer is made.)]

TABLE 3.—Reduction of Observed Specific Gravities to Specific Gravities at 60°/60° F.

NOTE

Specific-gravity values at 60°/60° F. corresponding to 0 to 10 degrees A. P. I. are here given to four decimal places in order that they may be consistent with the remainder of the table. In the earlier printing of this Circular the specific-gravity values were carried only to three decimal places.

January 6, 1938.

DANIEL C. ROPER, Secretary

NATIONAL BUREAU OF STANDARDS

LYMAN J. BRIGGS, Director

SUPPLEMENT TO NBS CIRCULAR C410

[Issued April 20, 1937]

Supersedes Supplements to Circular 154

ABRIDGED VOLUME CORRECTION TABLE FOR
PETROLEUM OILS

(Approved by American Petroleum Institute, American Society for Testing Materials, U. S. Bureau of Mines, and National Bureau of Standards. For complete table, see table 2, NBS Circular C410)

The table of reduction factors contained herein has been prepared to meet a demand from the oil industry for a short and convenient table for reducing oil volumes to the basis of 60° F when extreme accuracy is not required. It is not intended to replace the more complete volume correction table contained in Circular C410, but rather to supplement it and especially to replace the various abridged tables heretofore employed in the oil industry.

The groups, coefficients of expansion, degrees API, and gravity ranges for the several subdivisions of the present abridged table follow:

Group number	Coefficient of expansion at 60° F	Corresponding degrees API	Range of group (degrees API at 60° F)
0.....	0.00035	6	Up to 14.9.
1.....	.00040	22	15.0 to 34.9.
2.....	.00050	44	35.0 to 50.9.
3*	.00060	58	51.0 to 63.9.
4.....	.00070	72	64.0 to 78.9.
5.....	.00080	86	79.0 to 88.9.
6.....	.00085	91	89.0 to 93.9.
7.....	.00090	97	94.0 to 99.9.

*All motor fuel blends of gasoline and benzol shall be considered as falling in group 3. In cases of uncertainty regarding the presence of benzol, a product having a gravity heavier (numerically less) than 51° API and a 50 percent recovery point less than 293° F (145° C) shall be considered as falling in group 3.

This table shows the volume occupied at 60° F by a quantity of oil occupying unit volume at the indicated temperatures.

The columns showing temperatures in degrees Fahrenheit carry the heading *t*. The columns of multipliers which are actually

volume at 60° F
volume at t

carry the heading *M*.

This abridged table differs from that published in Revised Supplement to NBS Circular C154 issued in 1934 in three respects: The multipliers for group 0 have been revised slightly; group 1 has been extended from 249 to 499° F; and groups 4, 5, and 6 have been extended from 99 to 124° F.

The multipliers in the group 0 table in the Revised Supplement to NBS Circular C154 issued in 1934 were taken from the National Bureau of Standards Miscellaneous Publication M97. With the revision of Circular C154 (published as Circular C410) to include data on oils from 0 to 10° API, it has seemed desirable to employ the procedure followed in the other groups and choose the column of multipliers from the unabridged table which has a base coefficient of expansion nearest 0.00035, which, in the case of group 0, is the column corresponding to a gravity of 6° of API.

Group 0 (up to 14.9° API)

(t=temperature in degrees F; M=multiples)

EXAMPLE.—Values in the table are in the form of multipliers; that is, the volume of oil at the indicated temperature and degrees API for each group, multiplied by the corresponding factor in the table, equals the volume at 60° F. For example, if the degrees API of an oil at 60° F equals 58 (group 3) and the volume at 88° F equals 8,000 gal, then the volume at 60° F equals 8,000×0.9830 or 7,864 gal.
